Proving decision problems are in NP/co-NP

Show that  $L$  is in NP

1. Show that  $L$  is a decision problem
2. Provide a certificate for the verifier
3. Justify why the certificate is polynomial in terms of the size of the input
4. Provide a Verifier that runs on the input/certificate
5. Justify the Verifier halts and verifies solutions in polynomial time

# Prove that NP is closed under the concatenation operation

Prove that if  $L_1, L_2$  are in NP, then  $L_1 + L_2$  is in NP

$$L_1 + L_2 = \{ x \mid x = yz, y \in L_1, z \in L_2 \}$$

Assume that  $L_1$ , and  $L_2$  are in NP

$L_1 = \{ x \mid \text{exists } c \text{ (certificate), } |c| \text{ polynomial in terms of } |x|, V_1(x, c) \text{ accepts in } O(|x|^k) \}$

$L_2 = \{ x \mid \text{exists } c \text{ (certificate), } |c| \text{ polynomial in terms of } |x|, V_2(x, c) \text{ accepts in } O(|x|^j) \}$

1.  $L_1 + L_2$  is a Decision problem, either elements belong to the set or it doesn't
2. Let  $x$  be the input,  $C = (i, c_1, c_2)$  such that  $c_1$  verifies  $x[0:i]$ ,  $c_2$  verifies  $x[i:]$
3.  $|C| = |c_1| + |c_2|$ , by assumptions,  $C$  is polynomial in terms of  $|x|$ .
4. define  $V$  on input  $\langle x, C = (i, c_1, c_2) \rangle$ :
  - assert  $i$  in  $[0, |x|]$  #  $O(|x|)$
  - assert  $V_1(x[0:i], c_1)$  and  $V_2(x[i:], c_2)$  both accept #  $O(|x|^{\max(k, j)})$
  - if both all assertions pass accept, otherwise reject
5. All assertions are done in polynomial time, since  $V_1$  and  $V_2$  run in polynomial time.

# Prove that co-NP is closed under the concatenation operation

Prove that if  $L_1, L_2$  are in co-NP, then  $L_1 + L_2$  is in co-NP

$L_1 + L_2 = \{ x \mid \text{exists } y \text{ in } L_1, z \text{ in } L_2, \text{ such that } x = y + z \}$

$\text{co-}(L_1 + L_2) = \{ x \mid \text{forall } y \text{ in } L_1, z \text{ in } L_2, \text{ such that } x \neq y + z \}$

$\text{co-}(L_1 + L_2) = \{ x \mid \text{for } i \text{ in } [0, |x|], x[0:i] \text{ in co-}L_1 \text{ or } x[i:] \text{ in co-}L_2 \}$

Assume that  $L_1$ , and  $L_2$  are in co-NP

$\text{co-}L_1 = \{ x \mid \text{exists } c \text{ (certificate), } |c| \text{ polynomial in terms of } |x|, V_1(x, c) \text{ accepts in } O(|x|^k) \}$

$\text{co-}L_2 = \{ x \mid \text{exists } c \text{ (certificate), } |c| \text{ polynomial in terms of } |x|, V_2(x, c) \text{ accepts in } O(|x|^j) \}$

1. This is a decision problem, either an element is in  $L_1 + L_2$  or its not.
2. Let  $x$  be the input, let  $C = [C_0, C_1, \dots, C_{|x|}]$ , each  $C_i = (i, c1_i, c2_i)$ ,  $i \text{ in } [0, |x|]$
3.  $|C| = |x|$ , we know each  $|C_i|$  is polynomial from the previous question say  $O(|x|^m)$ , then we have  $O(|x| * |x|^m)$
4. define  $V$  on input  $\langle x, C = [C_0, C_1, \dots, C_{|x|}] \rangle$ :
  - for each  $C_i = (i, c1, c2)$  in  $C$ : #  $O(|C|) = O(|x|)$
  - assert that  $i \text{ in } [0, |x|]$  #  $O(|x|)$
  - assert that atleast one of  $V_1(x[0:i], c1)$  or  $V_2(x[i:], c2)$  accepts #  $O(n^c)$
  - if any assertions fail, reject
  - accept # we accept within  $O(|x| * (|x| + n^c))$
