## Q12

Let

$$B = (1, 1 + 2x, 1 + 2x + 3x^2, 1 + 2x + 3x^2 + 4x^3)$$

be an ordered basis for the vector space  $P_3$ . Find the coordinate vector of the polynomial

$$p(x) = 2 + 12x^2 + 4x^3$$

relative to the ordered basis  $B$ .

4 - Correct [p(x)]B

5 - System of equations

1 - Used System of Equations

Suppose that  $U$  and  $W$  are subspaces of the vector space  $V$ . Show that the set  $S = \{\mathbf{u} + \mathbf{w} : \mathbf{u} \in U \text{ and } \mathbf{w} \in W\}$  is a subspace of  $V$ .

Prove the following

3 - Inclusion of zero vector

3.5 - proof of additive closure

3.5 - proof of scalar multiplication closure

Linear Transformation is a function  $T: V \rightarrow W$

1.  $T(u + v) = T(u) + T(v)$ , for all  $u, v$  in  $V$

2.  $T(ru) = rT(u)$  for all  $u$  in  $V$ ,  $r$  in  $R$

17.  $T([x_1, x_2, x_3]) = [x_1 - x_2 + 3x_3, x_1 + x_2 + x_3, x_1]$

$$\begin{bmatrix} | & | & | \\ T(\vec{e}_1) & T(\vec{e}_2) & T(\vec{e}_3) \\ | & | & | \end{bmatrix} = \begin{bmatrix} 1 & -1 & 3 \\ 1 & 1 & 1 \\ 1 & 0 & 0 \end{bmatrix}$$

1.  $T: F \rightarrow \mathbb{R}$  defined by  $T(f) = f(-4)$

Linear Transformation is a function  $T: V \rightarrow W$

1.  $T(u + v) = T(u) + T(v)$ , for all  $u, v$  in  $V$

2.  $T(ru) = rT(u)$  for all  $u$  in  $V$ ,  $r$  in  $R$

let  $f, g$  in  $F$ ,  $r$  in  $R$

$$T(f + g) = (f + g)(-4) = f(-4) + g(-4) = T(f) + T(g)$$

$$T(rf) = (rf)(-4) = rf(-4) = rT(f)$$

$$\ker(T) = \{ f \text{ in } F \mid f(-4) = 0 \}$$

2.  $T: F \rightarrow \mathbb{R}$  defined by  $T(f) = f(5)^2$

$$f(x) = 1, g(x) = 2$$

$$T(f + g) = (1 + 2)^2 = 3^2$$

$$T(f) + T(g) = 1^2 + 2^2 = 5$$

$$T(f + g) \neq T(f) + T(g)$$

Linear Transformation is a function  $T: V \rightarrow W$

1.  $T(u + v) = T(u) + T(v)$ , for all  $u, v$  in  $V$

2.  $T(ru) = rT(u)$  for all  $u$  in  $V$ ,  $r$  in  $R$

$$(a + b)^2 \neq a^2 + b^2$$

8. Let  $F$  be the vector space of all functions mapping  $\mathbb{R}$  into  $\mathbb{R}$ , and let  $T: F \rightarrow F$  be a linear transformation such that  $T(e^{2x}) = x^2$ ,  $T(e^{3x}) = \sin x$ , and  $T(1) = \cos 5x$ . Find the following, if it is determined by this data.

- |                     |  |
|---------------------|--|
| a. $T(e^{5x})$      | c. $T(3e^{4x})$                                    |
| b. $T(3 + 5e^{3x})$ | d. $T\left(\frac{e^{4x} + 2e^{5x}}{e^{2x}}\right)$ |

a.

$$\begin{aligned} \text{b. } T(3 + 5e^{3x}) &= T(3) + T(5e^{3x}) = 3T(1) + T(5e^{3x}) = 3\cos 5x + 5T(e^{3x}) \\ &= 3\cos 5x + 5\sin x \end{aligned}$$

c.

$$\text{d. } T(e^{2x} + 2e^{3x}) = x^2 + 2\sin x$$

*Problem one.* Show that the composition  $S \circ T$  of the linear transformations  $S : V \rightarrow W$  and  $T : U \rightarrow V$  is a linear transformation.

Linear Transformation is a function  $T: V \rightarrow W$

1.  $T(u + v) = T(u) + T(v)$ , for all  $u, v$  in  $V$

2.  $T(ru) = rT(u)$  for all  $u$  in  $V$ ,  $r$  in  $R$

Let  $G = S \circ T$ , WTS  $G$  is a linear transformation  $G: U \rightarrow W$

let  $u, v$  in  $U$

$$\begin{aligned} G(u + v) &= S(T(u + v)) = S(T(u) + T(v)) \text{ [BC } T \text{ is a linear transformation]} \\ &= S(T(u)) + S(T(v)) = G(u) + G(v) \end{aligned}$$

let  $r$  in  $R$

$$G(rv) = S(T(rv)) = S(rT(v)) = rS(T(v)) = rG(v)$$

*Problem two.* Suppose that  $V$  is a vector space of dimension  $n$ , and that  $B$  is a linearly independent set in  $V$  with  $n$  elements. Show that  $B$  is a basis for  $V$ .

Suppose for a contradiction that  $B$  is not a basis for  $V$ . This means that there must be some  $v$  in  $V$ , such that  $v$  not in  $\text{span}(B)$ . If this is the case, then  $B$  union  $\{ v \}$  is a linearly independent set of  $n + 1$  elements subset of  $V$ . This is a contradiction as a subset of  $n + 1$  elements in  $V$  cannot be linearly independent, thus  $B$  must be a basis for  $V$ .

*Problem three.* Suppose that  $V$  is a vector space of dimension  $n$ , and that  $B$  is a subset of  $V$  with  $n$  elements which spans  $V$ . Show that  $B$  is a basis for  $V$ .

Suppose for a contradiction that  $B$  is a subset of  $V$  with  $n$  elements that span  $V$ .  
WTS  $B$  is linearly independent.

Assume for a contradiction that  $b \in B$  such that  $b \in \text{span}(B - \{b\})$ , if this is the case then  $\text{span}(B - \{b\}) = V$ .  $V$  cannot have dimension  $n$ , if it is spanned by a set of size  $n - 1$ .  $|B| = n$ ,  $|B - \{b\}| = n - 1$ .

*Problem four.* Suppose that  $T : V \rightarrow W$  is a linear transformation between vector spaces, and that  $S$  is a subspace of  $W$ . Show that the inverse image  $T^{-1}(S) = \{\mathbf{v} \in V : T(\mathbf{v}) \in S\}$  is a subspace of  $V$ .

$$T(0_V) = 0_W \quad T(\mathbf{v}) = 0_W$$

show that  $INVERSE = \{\mathbf{v} \in V \mid T(\mathbf{v}) \in S\}$  is a subspace of  $V$

1. inclusion of zero vector

since  $V$  is a vector space,  $0 \in V$ .  $T(0) = 0$ , thus  $0 \in INVERSE$

2. closure under addition

3. closure under scalar multiplication
